

Security Best Practices Guide

Protecting Your Account

1. Strong Passwords

Always use a strong, unique password for your account. A good password should be at least 12 characters long and include a mix of uppercase letters, lowercase letters, numbers, and special characters. Never reuse passwords across different services.

2. Two-Factor Authentication (2FA)

Enable two-factor authentication for an extra layer of security. We support authenticator apps (Google Authenticator, Authy) and SMS verification. Authenticator apps are recommended for better security.

3. Phishing Awareness

Be cautious of emails or messages asking for your login credentials. We will never ask for your password via email. Always verify the sender's email address and look for HTTPS in the URL before entering credentials.

4. Session Management

Always log out when using shared or public computers. Regularly review your active sessions in Settings and revoke any unrecognized sessions.

5. API Key Security

If you use API keys, never share them publicly or commit them to version control repositories. Rotate your API keys regularly and use environment variables to store them.

6. Data Backup

Regularly export and back up your important data. We provide automated backup options in the Settings panel under Data Management.

7. Reporting Security Issues

If you discover a security vulnerability, please report it to security@example.com. We take all reports seriously and will respond within 24 hours. Do not publicly disclose vulnerabilities before they are addressed.
